

Snapshot™
END USER SOFTWARE PACKAGE

The Snapshot™ software application provides the ability to grab images from a live MPEG-4 and/or H.264 feed. Images may be saved on the host computer or an FTP server.

Main "View Screen" of Snapshot

Customize the view selection of the main screen

- The Snapshot™ software module allows the user to hand select all the parameters to be shown in the main window.

Parameter Option List

Select the maximum amount of entries allowed

- The Snapshot™ software application provides the user to set a limit to how many active channels that may run simultaneously.
- The Snapshot™ software also allows for an unlimited number of channels.

Customize which channels to run.

- The Snapshot™ software application provides the user with a simple to use interface that allows them to hand select which channels to grab images from.
- The user may also select a Start All button to run all configured channels simultaneously.

Store the snapshots in multiple ways

- The Snapshot™ software application allows the user to store images as a file anywhere the host computer has access to.
- The user may also select "FTP" as a destination for the snapshots given the proper login information.

Window for configuring image destination

Save previous sessions

- The user has the option to save any session; storing all channels configured during the session into an XML file.
- When user closes and re-opens the Snapshot™ software, they can re-open any saved sessions.

Recommended Minimum Requirements
